

Part One: Interest Statements

Time management and social coordination are two everyday challenges that people constantly navigate. The mental effort required to organize, plan, and schedule, particularly for group events, can quickly become overwhelming. All of our team members have personally experienced the frustration of juggling multiple priorities, repeatedly sharing availability, and creating yet another group chat just to coordinate a single meetup. These inefficiencies often turn what should be enjoyable interactions into sources of stress. Motivated by these shared experiences, we are setting out to build a comprehensive and intuitive scheduling solution—one that simplifies personal task management while seamlessly supporting the coordination of group activities.

Yibing Ju (1009382829): I am excited to calibrate the interface and features of our product (including model capabilities) to improve UX.

Cynthia Zhou (1009028918): I am excited to work on the framework and system design for integrating AI into the application, focusing on how AI components interact with the app's core features in a reliable and scalable way.

Jonathan Chen (1008849310): I am excited to explore designing AWS architecture involving LLMs and mobile clients, focusing on low latency and high availability instead of scalability, since the architecture will be serverless.

Mark (1008992299): I am excited to work with AWS on backend implementation, particularly focusing on building robust infrastructure for deploying and serving our AI model to real users while ensuring reliability and performance at scale.

Part Two: Landscape Analysis

Relevant Item	Description	Commentary
When2meet (and alternatives such as crab.fit and Timeful)	Web applications that allow for multiple people to share availability for the purpose of scheduling meetups.	1. Availability is binary, rigid, and does not leave room for flexibility 2. A new group/new link needs to be created for each new event 3. Integration with personal calendar is either non-existent or very limited, therefore not providing context for occupied timeslots
Doodle	Simple scheduling app for a variety of use cases, such as appointments and team coordination.	1. Timeslot-based scheduling (with preference indicated by voting) requires a heavy upfront mental load 2. Targeted towards enterprises and businesses, with limited social aspects
Calendly	Calendly automates scheduling so users no longer have to email back and forth for availability and can focus on more meaningful work instead.	1. More for enterprise 2. Available as a web, mobile app, extension, and integrated with multiple platforms

TimeTree	Mobile app that lets friends and family share calendars, communicate about events, and coordinate schedules in one place.	1. Does not have any AI feature 2. Claimed to have 70 million users worldwide 3. Winner of the App Store Best of 2015
Rodeo	Rodeo leverages AI to facilitate the scheduling of activities with friends. Users can upload screenshots of social media posts, event listings, or even group chats, and the app will extract relevant information.	1. Need to join the waitlist in order to test it 2. Founded by the former COO + CPO of Hinge, targeted for dating purposes
Cal.com (Note: Open Source)	An open-source alternative to Calendly that gives you full control. Cal.com lets you manage your own data, customize workflows and branding, and deploy on your own domain—self-hosted or fully managed, API-driven, and white-label by design.	1. Primarily targets enterprise and personal-business use cases 2. Information-dense UI/UX makes quick, casual use difficult 3. Group chat-like functionality (“teams”) is behind a paywall 4. No clear AI features or AI-driven workflows 5. High learning curve; intimidating for first-time or casual users
Outlook/Google Calendar/Apple Calendar/Samsung Calendar	These are the major built-in and cloud-based calendar apps used for personal and professional scheduling. They focus on managing events, meetings, and reminders within their respective ecosystems.	1. Integration with their platforms: Microsoft tools (Outlook), Google apps (Gmail, Meet), Apple devices (iPhone, Mac), Samsung devices (Samsung ecosystem) 2. Support shared calendars, event invites, and basic collaboration 3. Limited AI-driven scheduling and minimal social or friend-based planning
Reclaim.ai	Reclaim AI is an AI-powered calendar assistant that automatically schedules tasks, meetings, habits, and focus time around your existing calendar. It continuously adjusts your schedule when conflicts arise to protect your priorities and deep work.	1. Uses AI to automatically schedule tasks and habits around existing calendar commitments 2. Lacks social features such as friend-based scheduling or shared event creation
Clockwise	Clockwise is an AI calendar optimization tool focused on creating larger, uninterrupted blocks of focus time. It reshuffles flexible meetings and resolves conflicts to reduce calendar fragmentation. Clockwise is best for teams with meeting-heavy schedules who want better focus without manual rescheduling.	1. Optimizes team calendars by rearranging meetings to increase focus time 2. Primarily designed for workplace and organizational scheduling 3. Does not support social connections or casual event planning
Structured	Structured is a visual daily planner app that combines your calendar events, to-dos, routines, and habits into a clear timeline so you can see your whole day at a glance. It lets you drag and drop tasks, add subtasks and notes, sync across devices, and use AI to draft or adjust your day based on natural-language input.	1. Provides a visual, timeline-based daily planner focused on personal routines 2. Prioritizes simplicity and user experience over advanced AI scheduling 3. No support for multi-user scheduling or social coordination

Summary: Across existing scheduling and calendar tools, solutions tend to fall at two extremes: enterprise-focused platforms that are powerful but complex, and lightweight availability-sharing tools that are simple but lack social capabilities and intelligent features. Many tools treat availability as binary, require repeated setup for each event, or offer limited integration with personal preferences and social dynamics. Traditional calendar platforms support basic sharing but provide minimal intelligence for coordinating group activities, while AI-driven tools largely focus on individual productivity or workplace optimization rather than social planning.

Part Three: Project Outline

Problem statement

Social scheduling is fragmented across tools that are either too complex or too simplistic, making everyday group coordination stressful, inefficient, and unnecessarily time-consuming.

Proposed solution: schedule + social mobile app

- **Shared calendar** with friends and groups
- **Adaptive scheduling** that automatically detects conflicts and suggests optimal alternatives based on priorities
- **Natural language & voice input** powered by an LLM to infer user intent, map it to calendar or social actions, and execute with user confirmation
- **Social activity recommendations** based on shared availability, preferences, and context

A high-level technical approach and milestones

The project is organized along both a temporal timeline and parallel development tracks.

While the timeline shows the high-level progression from design to final delivery, each track (service design, AI semantics, infrastructure, UI/UX, and testing) evolves continuously across phases.

More information: [Project Timeline Google Sheet](#) , [Detailed Milestone](#)

Service & System Design Track
Phase 1 - Define use cases and system scope - Design core objects: Task, Event, TentativeEvent, Availability, Relationship - Define user actions: create, reschedule, split, accept, reject, override - Define system vs user responsibilities and source-of-truth rules
Phase 2 - Implement core scheduling logic - Implement conflict detection and execution pipeline
Phase 3-4 - Integrate multi-user scheduling - Stabilize edge cases and consistency handling
AI Semantics & Reasoning Track
Phase 1 - Define intent taxonomy - Define failure modes and control logic
Phase 2 - Define AI input/output JSON schemas - Implement intent classification and proposal generation
Phase 3-4 - Improve reasoning quality and fallback handling - Finalize robustness and validation
Data & Infrastructure Track
Phase 2 - Set up IAM and AWS CDK - Provision databases and storage - Define schemas, access patterns, and data flows - Implement deployment scripts
Phase 3-4 - Add monitoring and logging - Optimize queries and performance
UI / UX & User Research Track
Phase 1 Define core interaction flows and control model
Phase 2 - Build high-fidelity UX prototype - Implement calendar and proposal review UI
Phase 3 Conduct first round of user testing and iteration
Phase 4 - Conduct second round of user research - Final UX polish
Testing & Quality Track
Phase 2 Add unit tests for scheduling and AI contracts
Phase 3 - Expand integration tests and invariant checks - Conduct load testing
Phase 4 - Full end-to-end regression testing - Multi-device and concurrency testing

Part Four: Project Press Release

Peachy, a Smarter Shared Calendar That Plans With You—and Your People

Toronto, ON — Today, **Peachy** introduced its shared calendar and event discovery platform designed to make planning effortless for couples, families, friends, and everyday groups. By combining natural language input, shared calendars, and AI-assisted scheduling, Peachy helps people go from “We should do this” or “Remind me to do that” to “It’s on the calendar” in seconds.

The Problem

Planning with others is harder than it should be. Group chats fill up with “Does this work for you?” messages. Calendars don’t talk to each other. Finding something everyone wants to do—and can attend—takes time and coordination most people don’t have.

The Solution

Peachy changes how people plan. Users simply say what they want—“Add dinner with Francisca tomorrow at 6 pm and notify us 30 minutes before”—and Peachy’s AI handles the rest. With its shared calendars, Peachy creates events, checks availability, and sends notifications to keep everyone in the loop. Peachy also helps people discover events and activities they’ll actually enjoy, and supports seamless integration to instantly invite your family and friends who are available.

Key Features & Benefits

Share Your Schedules, Instantly

- Create shared events using everyday language
- Automatically notify everyone at the right time
- One shared calendar for couples, families, and friends

Make Group Planning Simple

- Ideal for group coordinating schedules
- Quickly find times that work for everyone—no spreadsheets, no polls

Less Coordination, More Time Together

- Fewer messages, fewer conflicts, clearer plans
- Peachy handles the logistics so people can focus on showing up

What Users Are Saying

“Every time I want to hang out with friends or plan group project meetings, I end up checking schedules again or resending [when2meet](#) links. I never realized how repetitive that is until now.”

— **Tom**, university student

“Turning availability into an actual plan takes too many steps. Peachy’s AI can do it automatically from a single sentence.”

— **Alex**, parent of two

“I like being able to see suggested events that I can attend based on my own schedule. It makes it much easier to decide what we can actually do without switching between apps.”

— **Daniel**, community event organizer

Appendix

Hypothetical User Reactions Post-Launch

"I just said, 'Add dinner with Gukesh at The Keg tomorrow at 6,' and it was done. No reminders forgotten, no follow-ups needed."

— **Emma**, Peachy beta user

"We used Peachy instead of when2meet for our study group. It figured out a time that worked for all of us way faster."

— **Aisha**, university student

"Peachy doesn't just schedule events—it helps people discover experiences they'll actually enjoy together. We've been able to put the smile back on so many people's faces!"

— **Fu Qiang Wang**, Local Charity Event Manager

"My husband Léon always asks me to remind him when it's his turn to pick up the kids. Now I can just talk to Peachy and put it in our shared calendar in seconds so that he always gets a warm heads-up!"

— **Adrian**, Parent of two
